

	Tests for automation : Frontend		
	Test ID	Test Case Objective	Description
	A.4	To verify on adding the items to the inventory the correct details are displayed	Automating this test case will reduce the manual efforts of checking the details everytime
	A.6	To verify if user can remove an item from the inventory	This test case can be automated under functional testcase This test case can be a part of health check.
	A.7	To verify if the item details are displayed on clicking upon the items in the list	This is an end to end scenario.Automating this will help us during regression. This test case can be a part of health check.
	A.8	To verify if user can add the same item more than once in inventory	This test case can help us reduce the repetitive actions of adding the same item manually.Thus increasing the speed of execution
	Note : We can automate almost all the scenarios for the given case study . Test cases above should be on a high priority.		
	Tests for automation : Backend		
	TestID	Test Description	Description
	B.1	Verify a valid error is generated when user tries to add more items than that are available	Automated test case will be helpful for adding multiple items
	B.2	Verify the API status codes on adding an item to the I list and deleting an item from the list.	Verification of API status codes for end to end journey
	B.7	Verify if the recently added items are shown at the top of inventory	Automation test case as a part of health check
