Step 3 : Steps followed for execution :

1.Launch the URL

2.Verified if the title of the form is displayed

3.Verified if the language toggle was clickable

4.Verified if the drop down list has languages mentioned

5.Verified if username could be entered

6.Verified if the organisation name could be entered

7.Verified if the email could be entered

8.Clicked on the check box and the on submit

9.Verified if a successful message has been displayed

Step 6 : How I tracked the casestudy.

1.Analysed the application to find the locators of the elements

for which mostly I used css.

2.Made a generic utils java class which had all the methods I would need

to access,click the elements

3.Additional classes required were Sign-up feature for writing the scenarios

Step definition class for linking the code to scenario steps,

A java class for the code of sign-up form , a config file for all the test data

A driver executable for launching the browser

4. Generated a test report after the execution of the file.
